Why Local LLM (answered by Opus 4.7)

- >> PRIVACY & SECURITY (Your data never leaves your infrastructure)
- >> COST (one time HW price x tokens, predictable)
- >> OFFLINE (without internet + latency)
- >> FULL CONTROL + CUSTOMIZATION (no restriction + no rate limits)
- >> LEARNING + EXPERIMENTATION

Why not local (answered by Sonnet 4.6)

- >> Need best quality
- >> Low/occasional usage
- >> Don't want infrastructure
- >> Size (forgets context after ~8k tokens)
- >> Not creative, no real-time knowledge
- >> You need serious HW (GPU like RTX 3060+)
- >> Setup overhead (why we are here)

Hybrid?

	Local LLM	Cloud API
Quality (8B model)	☆☆☆	☆☆☆☆☆
Quality (32B model)	☆☆☆☆	☆☆☆☆☆
Setup difficulty	Hard ❌	Easy ✅
Maintenance	You ❌	Provider ✅
Scaling	Limited ❌	Infinite ✅
Privacy	Perfect ✅	Good ⚠️
Cost (low volume)	Expensive ❌	Cheap ✅
Cost (high volume)	Cheap ✅	Expensive ❌
Offline use	Yes ✅	No ❌
Latest knowledge	No ❌	Yes ✅
Reliability	Your problem	SLA ✅
Tool/function calling	Unreliable ⚠️	Reliable ✅
Context window	8-32k ⚠️	1M tokens ✅

How to run local LLM? SW+HW

HW?

>> Experiments? just CPU. Deep dive? capable GPU (like RTX3060 12GB - € 300)

>> Virtual or physical

SW?

>> User Interface - CLI or Open WebUI

>> Runtime - **Ollama** (LM Studio, llama.cpp)

Usage?

>> Chat, vibe coding, MCP servers, agents

Goal of the workshop?

Having running local LLM model accessible via command line, API and GUI and ready for further experiments like “vibe coding”.

Our setup? (your laptop)+runpod.io

For Lab A - your laptop (or your VM) or cpu-xx pod in runpod.io

>> Web terminal

For Lab B - pod gpu-xx with Ollama+Open WebUI accessible via 3 URL's

>> Web terminal

>> Ollama API

>> Open-WebUI
